Conclusion

The basic steps of a threat risk assessment are:

1. characterize the type of system that is at risk
 2. identify specific threats to that system
 3. determine inherent risks and impacts
 4. analyze and identify existing controls that may prevent, mitigate, detect, or compensate for potential threats
 5. assess the extent to which existing controls successfully mitigate the threats
 6. determine the likelihood of a threat occurring based on current controls; and
 7. calculate a risk rating based on a combination of impact and likelihood of occurrence.

The greatest institutions are the ones that have survived for generations because of careful planning by their founders. Once they realized how important their cause was and how important it is to continue this work to benefit mankind, these wise founders began to lay the ground work and create the foundations for future generations to continue that work.

With great foresight, the founders of these institutions engineered their systems to be flexible and adaptable to changing conditions, and changing societal values, for if it were not for this flexibility, future generations would quickly fall away and the original idea would fade from memory.
